Project Description:

Research projects are available for graduate students on a range of topics within infectious-disease epidemiology fields. The ongoing projects include large-scale operational and intervention studies for improving health and access to health care services among key and marginalized populations in Cambodia. These studies aim to identify social determinants and effective community-based interventions for improving new case detection and linkage to care, treatment, and support services among people at risk of HIV and tuberculosis. We also work on broader health issues surrounding the life of HIV and tuberculosis key populations, including sexual and reproductive health, gender-based violence, mental health, and social stigma and discrimination. Specific available projects are subject to further discussion.
